

EGEO

Versión 2

The Spanish Geospatial common service: EGEO

Miguel A. Amutio
Deputy Head of Unit Coordination of ICT Units
Directorate for Information Technologies and Communications
Ministry of Finance and Public Administrations
Spain

What is EGEO

Goal: EGEO allows the representation of maps with geo-referenced data; without the need for software development.

Scope: EGEO provides maps (thematic, geo-referenced and magnitude) on the basis of the information provided by the user entity and searcher of resources both on official geo-referenced maps of the IGN (National Geographic Institute), as well as of Google Maps.

The user entity embeds the maps in its website or application.

It also allows the generation of graphics (line, area, bar, column and sectors, and data tables).

Owner: Directorate for Information Technologies and Communications of the General State Administration

Target group: Entities of the Administration. Currently around 60 entities are carrying integration tests (including AEAT, GISS, MSSI, IGAE, INE, etc.)

Starting date: December 2014

**Service of maps
for Public
Administrations**

**Data maps
and searcher
of resources**

**Also graphics
and tables**

What is the impact of EGEO

- EGEO facilitates the integration of geo spatial information in administrative processes.
- It provides cost savings because of the simplicity and the potential of the idea.
- Cloud service, based on open source, adapted to mobile devices.

Some feedback about EGEO:

EGEO is useful, easy and offers spectacular possibilities, (DTIC)

EGEO is a good tool, intuitive and easy to use, with great potential range of use despite its simplicity (GISS)

EGEO is an example of how to integrate geospatial information in administrative processes
(CNIG)

EGEO is a best practice in the implementation of the Spatial Data Infrastructures
(CNIG)
